A thermocouple flow sensor is a sensor used to measure fluid flow. It uses the principle of heat conduction to determine the flow rate of the fluid. Depending on the design and working principle of the flow sensor, a thermocouple flow sensor can measure the flow rate of gas or liquid. By measuring the temperature difference between the heating element and the measuring element, the flow rate of the fluid can be determined. This type of sensor is typically used in applications that require high accuracy and fast response, such as gas flow measurement, air flow measurement, and some chemical and environmental monitoring applications.

The global Thermocouple Flow Sensor market size is projected to grow from US\$ 595 million in 2024 to US\$ 805 million in 2030; it is expected to grow at a CAGR of 5.2% from 2024 to 2030.
