The global Thermoelectric Wine Cellars market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

A semiconductor/thermoelectric wine cellar uses a different process to remove heat from the interior cabinet, one based upon the Peltier effect, which is named for the 19th century scientist who discovered it.

In this process, an electric current is sent through two pieces of metal that have been joined together. Because the two sides of the device are made of different materials, a heat flux is created and heat flows from one side to the other. One side gets hot while the other gets cold. The hot side of the device is attached to a heat sink, a large passive component made up of stacks of aluminum fins that is designed to let heat dissipate efficiently. The cold side is installed inside the cooler cabinet. Heat is absorbed from the interior, passes through the Peltier element into the heat sink, and then dissipates into the air.
