Thermoplastic polycarbonate resin is a tough thermoplastic resin whose name comes from its internal CO₃ group. Can be synthesized from bisphenol A and carbon oxychloride. High molecular polymers containing carbonate groups in the molecular chain can be classified into aliphatic, aromatic, and aliphatic-aromatic types according to the structure of the ester group. Among them, due to the low mechanical properties of aliphatic and aliphatic-aromatic polycarbonates, their application in engineering plastics is limited. Only aromatic polycarbonates have been produced industrially. Due to the structural speciality of polycarbonate, it has become the fastest growing general engineering plastic among the five major engineering plastics.
