The global Thin Carrier Tape for Electronic Components market size is predicted to grow from US$ 1283 million in 2025 to US$ 1862 million in 2031; it is expected to grow at a CAGR of 6.4% from 2025 to 2031.

Paper carrier tape and plastic carrier tape are mainly used for packaging passive and active components, respectively. According to their different reactions to current, electronic component products can be divided into two categories: passive electronic components and active electronic components. Among them, passive electronic components are a type of component that only consumes input signal power and can process and transmit signals without the need for a power source. They are also known as passive components; Active electronic components require devices to provide corresponding power, also known as active devices. There are many types and specifications of electronic components, and there are also many specifications of thin carrier tapes that come with them. According to the different raw materials used, thin carrier tapes are mainly divided into paper carrier tapes and plastic carrier tapes. Paper carrier tapes have the characteristics of low price and easy recycling, and are preferred by electronic component manufacturers. They can be used for packaging electronic components with a thickness of no more than 1mm, mainly suitable for passive components such as RCL devices (resistors, capacitors, inductors); When the thickness of electronic components exceeds 1mm, considering the bending conditions and thickness limitations of paper carrier tapes, plastic carrier tapes are generally used for packaging. Plastic carrier tapes are suitable for active components such as integrated circuits, semiconductor products, and passive components with larger thicknesses. In addition, paper carrier tapes need to be used in conjunction with upper and lower tapes,

while plastic carrier tapes need to be used in conjunction with upper cover tapes.
