Thin film inductor coil is an inductive component made of thin film material. Thin film inductor coils are usually formed by depositing a metal film on a film substrate, and then forming the coil structure through processes such as photolithography and etching. Compared with traditional wire-wound inductors, film inductors have the advantages of small size, light weight, fast frequency response, and high precision. Thin film inductors are widely used in wireless communications, radio frequency circuits, sensors, power conversion and other fields.

The global Thin Film Inductor Coil market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
