## Abstracts

The global Thin Film NTC Temperature Sensor market size is predicted to grow from US\$ 185 million in 2025 to US\$ 225 million in 2032; it is expected to grow at a CAGR of 2.9% from 2026 to 2032.

Thin film NTC temperature sensor is a temperature measurement device based on the principle of negative temperature coefficient (NTC) thermistor. Its core feature is the use of thin film technology to prepare sensitive materials in thin film form, in order to achieve high-precision, fast response, and miniaturized temperature measurement.

The market for thin film NTC temperature sensors has shown a steady growth trend in recent years, mainly benefiting from the sustained demand for high-precision and miniaturized temperature sensing solutions in fields such as consumer electronics, automotive electronics, and medical equipment. With the rapid development of 5G, the Internet of Things, and the new energy industry, the market has significantly increased its attention to thin-film NTC products that are responsive, low-power, and heat-resistant. Manufacturers are actively optimizing production processes to reduce costs, while enhancing product competitiveness through integrated design (such as combining digital interfaces). Despite facing price competition from traditional thick film NTC, the irreplaceability of thin film technology in high-end application scenarios has driven its market penetration. In the future, with the rise of emerging applications such as smart wearables and AR/VR, thin-film NTC temperature sensors are expected to further expand their market space, but technological maturity and supply chain stability remain key challenges that the industry needs to pay attention to.
