Thin film thickness monitor crystals are precision quartz crystal sensors used in physical vapor deposition (PVD) and other thin-film coating processes to measure the rate and thickness of material being deposited in real time. These crystals operate on the principle of a quartz crystal microbalance (QCM), where the frequency of the crystal's vibration changes as material accumulates on its surface. By monitoring this frequency shift, the system can accurately calculate the thickness and deposition rate of the thin film. These monitor crystals are essential for ensuring precise film thickness control in applications such as semiconductor fabrication, optics, and nanotechnology.
