A thin film transistor (TFT) is a distinct class of field-effect transistor (FET) produced by depositing thin-films of an active semi-conductor layer along with the dielectric layer & metallic connections over a supporting substrate. It is also a type of flat-panel LCD display screen, in which each pixel is controlled by one to four transistors. This transistor could be made using an extensive variety of semi-conductor materials where a popular material is silicon. Transistors are embedded inside the panel itself, lessening crosstalk between pixels & improving image stability. The primary application of thin film transistors is within TFT LCDs, an implementation of liquid crystal display technology.

United States market for Thin Film Transistor is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
