The global Thin Layer Chromatography Systems market size is predicted to grow from US\$ 187 million in 2025 to US\$ 262 million in 2031; it is expected to grow at a CAGR of 5.7% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Thin Layer Chromatography Systems is a method of separating and analyzing substances that uses the interaction between stationary phase and mobile phase to separate substances into different components. Thin Layer Chromatography Systems lays a thin layer of stationary phase on a paper or glass plate, then points the sample to be measured on the stationary phase, and then uses mobile phase to develop it to separate different components on the stationary phase. Colorant or other detectors are used for detection.

In order to further improve the separation effect and analysis accuracy, Thin Layer Chromatography Systems will adopt multi-dimensional separation technology in the future. Multidimensional separation technology can comprehensively utilize the advantages of thin layer chromatography and combine it with the advantages of other separation technologies (such as gas chromatography, high-performance liquid chromatography, etc.) to improve separation effects and analysis accuracy.
