Three-dimensional wound core transformer is a special type of transformer, which adopts three-dimensional wound core structure. The transformer core of the three-dimensional wound core transformer is composed of multiple lamellar iron cores, forming a three-dimensional structure. This structure can effectively reduce magnetic flux leakage and reluctance, thereby improving the efficiency and performance of the transformer. Three-dimensional wound core transformer has the characteristics of high efficiency, high performance, low noise and low loss. It is improved on the basis of the traditional iron core transformer, making the performance of the transformer even more superior. Compared with traditional core transformers, three-dimensional wound core transformers have smaller size and weight, while also being able to withstand greater

current and power. Three-dimensional wound core transformers are widely used in power systems, industrial fields, and energy fields, etc., for power conversion and distribution tasks such as voltage transformation, voltage boost, step-down, and power distribution. It is suitable for various load types and working environments and can provide stable and reliable power supply.
