The three element rotary vibrating screen is a commonly used screening equipment, suitable for dry or wet screening of materials. It consists of three layers of screen mesh, each layer of screen mesh has different pore sizes and is used to separate particles of different sizes in the material. The three element rotary vibrating screen uses the excitation force generated by the excitation motor to cause the screen to rotate and vibrate. Materials are evenly distributed on the screen surface. Larger particles will be affected by centrifugal force and move radially outward along the screen surface, while smaller particles will fall into the next layer of screen through the sieve holes or be discharged through the sieve holes. Through the continuous screening process, the graded screening of materials is achieved.

The three element rotary vibrating screen is used to screen various powdery, granular or fibrous materials. It has the advantages of high screening efficiency, large processing capacity, high precision, easy operation, etc., and can meet the screening requirements of different materials. It should be noted that when using a three-element rotary vibrating screen, the appropriate screen aperture and excitation force should be selected according to the characteristics of the material to obtain the best screening effect.
