A type of foundation system used in offshore wind power projects, which consists of a jacket structure supported by three piles. These piles are driven or installed into the seabed to provide the necessary stability and bearing capacity for the wind turbine. The jacket structure typically includes leg columns that are connected to the piles in a manner that allows for the transfer of loads from the wind turbine to the seabed. This foundation system is designed to withstand the lateral and vertical loads generated by the wind turbine, as well as environmental factors such as waves and currents.
