The global Three-Prong Graspers market size is predicted to grow from US\$ 54.8 million in 2025 to US\$ 66.2 million in 2031; it is expected to grow at a CAGR of 3.2% from 2025 to 2031.

Three-Prong Graspers are used to facilitate the removal of stones and the retrieval of foreign objects under direct vision.

A three-jaw grasper, also known as a three-jaw gripper or three-jaw forceps, is a medical device commonly used in endoscopic and surgical procedures to grasp, hold, and manipulate tissue or objects. Three-jaw grippers are usually made of stainless steel or other medical-grade materials and have three claw-shaped gripper heads, similar to a three-jaw pliers. These claw-like heads can be opened and closed to grasp or release targeted tissue or objects. During endoscopic surgery, the doctor introduces the three-jaw grasper into the patient's body through the endoscope, and then uses the claw head of the instrument to grasp, hold or manipulate internal tissues. These procedures often help doctors take tissue samples, remove small lesions or foreign objects, or perform other minimally invasive procedures.
