The global Three-Terminal Fuse market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A three-terminal fuse is a chip-type surface mount device that protects against overcurrent and overcharging. It contains a fuse element to ensure stable operation under normal current and to cut off the current when overcurrent occurs. It also includes resistive heating elements that can be used in conjunction with voltage sensing devices such as ICs and FETs. When overvoltage is detected, the heating element is electrically excited to generate heat and blows the fuse element to achieve overvoltage protection. It is usually used in lithium-ion battery packs as secondary protection, so that it can act promptly when encountering the risk of over-current and over-voltage, effectively reducing the risk of fire and explosion caused by overcharge, over-discharge, short circuit and other faults of lithium-ion batteries. Control circuit and device damage to as small an area as possible.
