The three-way defrost valve is a control valve used in refrigeration equipment. It can realize defrost and refrigeration of the air cooler through electromagnetic reversal. The working principle of the three-way defrost valve is: through the electronically controlled pneumatic three-way valve, the high-temperature and high-pressure gas that has not been condensed is introduced into the evaporator to be defrosted, and the condensed high-temperature gas is used to melt the frost on the evaporator. The advantage of the three-way defrost valve is that it can save energy, improve refrigeration efficiency, and extend the service life of refrigeration equipment. The disadvantage of the three-way defrost valve is that it requires an additional electronic control system, which increases the cost and difficulty of maintenance. The application scope of the three-way defrost valve is mainly refrigeration equipment such as cold storage, freezers, and air coolers.

The global Three-Way Defrost Valve market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
