Thromboelastography (Thromboelastography) is a new blood viscoelastic detection system suitable for bedside detection. It uses whole blood samples to monitor the whole process of blood coagulation and fibrinolysis, which can well make up for the deficiency of traditional blood coagulation detection.

Thromboelastogram provides a general picture of coagulation function. It is an inspection item that can dynamically monitor the whole process of coagulation and fibrinolysis. It can completely describe the whole process of a blood sample from coagulation initiation, coagulation and dissolution, and help doctors quickly judge the patient's coagulation status (high coagulation, low coagulation and fibrinolytic hyperactivity) and analyze the causes.

It is of great value in clinical evaluation of coagulation function, guidance of component transfusion, prediction of thrombosis/bleeding risk and guidance of medication.
