Thrombosis Viscoelastic Analysis is a viscoelastic method that measures the viscoelastic properties of blood clot formation. Thrombosis is the process of a blood clot formation formed in a blood vessel. Thrombosis clot can lead to blockage or cause obstruction in blood flow in the injured area, and besides can lead to severe problems when the clot travels to a vital parts of the circulatory system, such as the brain or the lungs.

Immediate treatment after diagnosis of thrombosis is essential to prevent damaging of the blood vessels and to avoid further clots forming. Without treatment, blood clots can lead to life-long health problems and can be life threatening.

Viscoelastic testing measures clot formation in whole blood, by which detects the time to the required for the beginning of the clot along with measurement of the total strength and stability of the clot, which is useful in early treatment of thrombosis.

An increasing incidences of Venous Thromboembolism (VTE) together with various pulmonary and cardiovascular diseases which may lead to life-threatening diseases because of rising number of blood clot formation cases is increasing the need for Viscoelastic Analysis Systems.
