The global Through Glass Via (TGV) Foundry Service market size is predicted to grow from US$ 425 million in 2025 to US$ 1240 million in 2031; it is expected to grow at a CAGR of 19.6% from 2025 to 2031.

Through-glass via (TGV) foundry refers to the process of making tiny vertical through holes (usually with a diameter of 10?m~100?m) on high-quality borosilicate glass or quartz glass substrates through a series of high-precision processes, and filling these through holes with conductive materials (such as copper) to achieve electrical connections. This technology uses laser etching, inductively coupled plasma dry etching and other methods to prepare through holes. It has the advantages of excellent high-frequency electrical properties, strong mechanical stability, low cost, and simple process flow. It has broad application prospects in the fields of precision devices such as Mini/Micro LED direct display and semiconductor advanced packaging substrates.
