The global Through-Hole Mounted Electric Double Layer Capacitors market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

A through-hole mount electric double layer capacitor is an electronic component that is a capacitor that stores electrical charge. Its design is based on the principle of electric double layer capacitance, also known as a supercapacitor. It usually consists of two layers of metal electrodes and a dielectric layer with an electric double layer between the electrodes and the dielectric layer. Via is a term for holes drilled on a circuit board. Through these holes, electronic components can be connected to the circuit on the circuit board. The through-hole mounted electric double layer capacitor is to weld the electric double layer capacitor on the circuit board through the through hole to store the charge and play the role of filtering and voltage stabilization in the circuit. Through-hole mounted electric double layer capacitors are generally used in circuits that require high performance, high stability, and long life, such as electronic instruments, communication equipment, automotive electronics, and other fields.
