The global Through Hole Wirewound Resistors market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

A through-hole wirewound resistor is a type of resistor characterized by a through-hole structure formed by winding a resistive material around an insulating material with good electrical conductivity. The resistance value of the resistor is adjusted by factors such as the number of turns of the winding, the diameter of the wire, and the material. Through-hole wirewound resistors usually have an insulating material as a supporting structure, and the resistive material is wound on the insulating material by winding or printing techniques to form one or more winding rings. The winding rings are connected through connectors or through holes to form a circuit of resistors.
