The global Thrust Tapered Roller Bearing market size is predicted to grow from US\$ 6188 million in 2025 to US\$ 9656 million in 2032; it is expected to grow at a CAGR of 6.8% from 2026 to 2032.

Global sales of thrust tapered roller bearings reached 21.36 million units in 2025, with an average price of \$296 per unit.

Thrust tapered roller bearings are separable thrust bearings with tapered rollers as rolling elements and inner and outer ring raceways that converge at a single point on the bearing axis. They can only withstand large unidirectional axial loads and can simultaneously accept radial loads not exceeding approximately 15% of the axial load. Due to sliding friction between the large end of the roller and the flange, their limiting speed is lower than that of thrust ball bearings, and they are commonly used in low-speed, heavy-load applications.

Thrust tapered roller bearings typically use high-carbon chromium bearing steel GCr15 (or carburized steel 20CrMnMo, G20CrNi2MoA) for the rings and rollers. The cages are primarily solid brass (MB), with extra-large sizes using steel pin-type (E-type). Raw material costs account for 55-60% of the ex-factory price, with bearing steel bars/forgings accounting for the highest proportion (approximately 40%), and the copper cage and rolling elements combined accounting for 10-15%. Machining, heat treatment, and testing costs account for approximately 25-30%. Due to the need for vacuum degassing and electroslag remelting of high-end steel and the reliance on imports for large-size copper cages, there is little room for negotiation on core components, resulting in raw materials accounting for approximately 90% of the total BOM (Bill of Materials).
