Thyroid eye disease is an eye disease caused by autoimmune hyperthyroidism. The role of thyroid eye disease treatment drugs is mainly to relieve symptoms and prevent the progression of diseases such as proptosis by adjusting thyroid function, suppressing immune response, and reducing inflammation. These medications are often used together when treating thyroid eye disease, and the specific treatment plan will be based on the patient's symptoms and severity of the condition. During treatment, doctors usually adjust the dosage and type of drugs based on the patient's response and changes in condition. Overall, these drugs work by modulating the immune system and thyroid function to reduce symptoms and control disease progression.
