A high tibial osteotomy (HTO) is a surgical procedure that realigns the knee joint. For some patients who have knee arthritis, this surgery can delay or prevent the need for a partial or total knee replacement by preserving damaged joint tissue.

The Tibia Osteotomy Plate is designed to fit the medial proximal tibia, reducing the need for intraoperative bending and soft tissue irritation. Different plate options are available to accommodate varying patient anatomy. The solid midsection provides the strength necessary to sustain the osteotomy. The tapered plate end facilitates minimally invasive insertion. The Combi holes provide the flexibility of axial compression and locking capability. The most proximal holes (plate head) and most distal holes (plate shaft) accept locking screws, aiding in angular stability. (Johnson & Johnson)
