A tiltrotor aircraft is a type of aircraft that combines the vertical takeoff and landing (VTOL) capabilities of a helicopter with the speed and range of a fixed-wing airplane. It achieves this by having rotors that can tilt from vertical to horizontal positions, allowing it to take off and land vertically like a helicopter and then tilt the rotors forward for horizontal flight like an airplane. Tiltrotor aircraft offer the versatility to operate in a variety of environments, making them suitable for military, civilian, and commercial applications, including search and rescue, troop transport, medical evacuation, and offshore operations. They can fly faster and farther than traditional helicopters while still being able to access remote or confined areas without the need for runways.

The global Tiltrotor Aircraft market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
