A timber mill is a facility where logs are cut into lumber. Modern timber mills use a motorized saw to cut logs lengthwise to make long pieces, and crosswise to length depending on standard or custom sizes (dimensional timber). The 'portable' timber mill is of simple operation. The log lies flat on a steel bed, and the motorized saw cuts the log horizontally along the length of the bed, by the operator manually pushing the saw. The most basic kind of timber mill consists of a chainsaw and a customized jig ('Alaskan timber mill'), with similar horizontal operation.
