The global Time-Resolved Interferometry market size is predicted to grow from US$ 115 million in 2025 to US$ 248 million in 2031; it is expected to grow at a CAGR of 13.6% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Time-resolved interferometer is a high-precision optical instrument that measures and analyzes rapidly changing physical phenomena in real time through the principle of interference. It can capture the dynamic characteristics of transient processes with extremely high temporal resolution (usually in the picosecond to femtosecond range). It uses synchronized laser pulses or other time-precise light sources to generate interference patterns at the moment the target phenomenon occurs, and by analyzing the changes in the interference fringes, it can obtain the fine changes in displacement, deformation, temperature, pressure and other parameters of the measured object over time. Time-resolved interferometers are widely used in laser physics, plasma research, materials science, fluid mechanics, ultrafast phenomenon research and other fields, and are particularly suitable for capturing high-speed dynamic processes in extremely short periods of time.

United States market for Time-Resolved Interferometry is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Time-Resolved Interferometry is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
