Titanium dioxide (TiO<sub>2</sub>) ceramic substrates are a type of material commonly used in electronic and optical applications. TiO<sub>2</sub> has a high refractive index, high thermal stability, and good electrical insulation properties, making it an attractive material for use as a substrate in various applications. In electronics, TiO<sub>2</sub> ceramic substrates are commonly used in applications such as gas sensors, optical fibers, and photovoltaic cells. In optics, they are used in applications such as high-power laser optics, mirrors, and high-precision optical systems. TiO<sub>2</sub> ceramic substrates are also used in other applications such as biomedical engineering, where they can be used as implant materials or as scaffolds for tissue engineering. There are two main forms of TiO<sub>2</sub>: anatase and rutile. The form used as a substrate depends on the specific application, and both forms have their own unique properties and advantages. Overall, TiO<sub>2</sub> ceramic substrates have a combination of high thermal stability, good electrical insulation, and high optical transparency, making them a versatile and widely used material in many different fields.
