Tire mirror, also known as toroidal lens, is an optical element formed by rotating an arc around an axis with another arc. There are two curvatures in the x direction and y direction, and the two directions are shaped separately. After reflection, there is no image deformation problem of ordinary plane reflectors and single spherical reflectors, which reduces the volume of the optical system and makes the debugging of the optical system more convenient. It is simple, improves the performance of optical systems, and is widely used in optical instruments, imaging systems, scanners, bioanalytical instruments, medical equipment, etc.

The global Tire Mirror market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
