Tire noise reduction foam is a material specially designed to reduce tire noise generated during vehicle driving, and is usually installed on the inner wall of the tire. Its main function is to absorb and attenuate the vibration and sound waves generated when the tire contacts the road, reduce the transmission of noise, and thus improve the quietness and ride comfort in the car. The process of installing noise reduction foam is generally to stick it on the inner wall of the tire during the tire production process, ensuring that it is evenly distributed to maintain the balance of the tire.

The global Tire Noise Reduction Foam market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
