Tire skeleton materials refer to a class of materials used to enhance the structural strength, stability and shape of tires during tire manufacturing. These materials are usually made of high-strength fibers or wires, which together with rubber form a composite material to ensure that the tire has excellent performance in bearing weight, resisting wear and maintaining inflation. These skeleton materials are combined with rubber in a specific way (such as weaving and winding) to form different structural layers of the tire, such as carcass plies, belt layers, cap layers, etc., which work together to give the tire good comprehensive performance and adapt to different road conditions and driving needs.

The global Tire Skeleton Materials market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
