The global Tire Valve for Two-wheeled Vehicle market size is predicted to grow from US\$ 349 million in 2025 to US\$ 377 million in 2032; it is expected to grow at a CAGR of 1.1% from 2026 to 2032.

Tire Valve for Two-wheeled Vehicle refers to the valve that is used to inflate or deflate the tires of two-wheeled vehicles such as motorcycles, bicycles, or scooters. The valve is typically located on the inner side of the tire and acts as a passage for air to enter or exit the tire.

The most common type of valve used in two-wheelers is the Schrader valve, which is also commonly found in car tires. It consists of a valve stem with a valve core that can be depressed to release air or tightened to seal the valve. To inflate the tire, a pump or air compressor with a compatible nozzle can be attached to the valve, allowing air to be pumped into the tire. To deflate the tire, the valve core can be unscrewed slightly to allow air to escape. In recent years, some modern bicycles and motorcycles have started using the Presta valve, which is a narrower and lighter valve compared to the Schrader valve. Presta valves require an adapter or a specific pump head to inflate them due to their unique design. However, Schrader valves are still the more widely used valve type on two-wheelers. Proper maintenance of the tire valve is important to ensure a secure seal and prevent air leakage. Regularly checking the valve's condition, ensuring it is not damaged or leaking, and keeping it clean can help maintain tire pressure and ensure efficient and safe two-wheeler operation.
