Tissue blocks have been collected and stored over the years for use in molecular epidemiology, clinical trials and other basic research purpose. Tissue block storage is important for maintaining the diagnostic integrity of the tissue over the storage period. Various organizations have set up guidelines for handling and processing biological tissues. Due to the irreplaceable property of biological tissues, the preservation becomes necessary as it provides information and data for molecular epidemiological studies used for cancer research. The tissue block storage can be performed using automated freezer systems. This can help in the long-term storage and retrieval of the diagnostic tissue properties. Recently the bar code systems have been set up for labelling of tissues for privacy protection of the data generated by the research using stored tissues.
