The global Tissue Fixative market size is predicted to grow from US$ 29.6 million in 2025 to US$ 41.3 million in 2031; it is expected to grow at a CAGR of 5.7% from 2025 to 2031.

In histopathology, tissues must first undergo timely and effective fixation to complete subsequent embedding and sectioning. The purpose of tissue fixation is to preserve the inherent shape and structure of tissues and cells, prevent bacterial corrosion and autolysis of tissue cells, preserve intracellular substances, coagulate proteins inside cells, minimize or terminate both endogenous and exogenous enzymatic reactions, and maintain the tissue or cell's material composition similar to that in living conditions. It also hardens the tissue, making it easier to section. For specimens with infectious potential, fixation helps prevent the spread of disease and preserves gross specimens. Lastly, fixation enhances the staining process. Formaldehyde is the most commonly used fixative due to its strong penetration, uniform fixation, minimal tissue shrinkage, and appropriate hardness, making it suitable for fixing the vast majority of tissue samples.
