The global Titanium Cathode Drum market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A titanium cathode drum is a cylindrical component used in electroplating processes, particularly in the production of electrodeposited copper foils. Constructed from titanium, this drum serves as the negative electrode in the electroplating cell, where it attracts positively charged metal ions from the electrolyte solution. The drum's titanium construction is favored for its exceptional corrosion resistance and durability, which are essential for withstanding the harsh chemical environment of electroplating baths. As copper ions are deposited onto the drum's surface, a thin layer of copper foil is formed, which is subsequently peeled off for use in various applications, such as in printed circuit boards (PCBs) and other electronic components. The titanium cathode drum ensures consistent quality and performance by maintaining stability and reducing contamination during the plating process.

United States market for Titanium Cathode Drum is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
