The global Titanium Diboride (TiB₂) Micron Powder market size is predicted to grow from US\$ 51.13 million in 2025 to US\$ 68.81 million in 2032; it is expected to grow at a CAGR of 4.4% from 2026 to 2032.

Titanium Diboride (TiB₂) Micron Powder is a grayish-black powder with the chemical composition TiB₂ and a particle size typically ranging from 1 to 10 μ m. This powder exhibits extremely high hardness, good thermal stability, and electrical conductivity, and is inert to non-ferrous metal melts. It can be prepared through carbothermal reduction, self-propagating high-temperature reaction (SHS), mechanical alloying, or sol-gel precursor methods, and can be further processed into industrial components such as ceramic blanks, composite reinforcing materials, wear-resistant tools, evaporation boats, and refractory parts. In 2025, global production of Titanium Diboride (TiB₂) Micron Powder was approximately 977.07 tons, with a unit price of approximately US\$53.5/kg and a gross profit margin of approximately 18.71%.

From a global supply perspective, the international market is dominated by a few large, established manufacturers holding technological and production capacity advantages. These include core companies such as H $\ddot{u}$ gan $\ddot{u}$ s (Sweden), Momentive Technologies (USA), 3M (USA), and Treibacher Industrie (Austria). These companies possess advanced powder synthesis processes and downstream application technologies, while offering diverse particle sizes and purity specifications. The Chinese domestic market, on the other hand, is characterized by a fragmented distribution of small and medium-sized enterprises (SMEs). Although their individual production capacity is smaller than that of international giants, they possess rapid expansion potential through technological iteration and supply chain localization. The top five brands account for over 49% of the global market. Companies like H $\ddot{u}$ gan $\ddot{u}$ s, Momentive, and 3M are

technologically advanced, hold leading market positions, and are world-renowned suppliers. The Asia-Pacific market accounts for approximately 46% of the global market, while Europe and North America account for approximately 27% and 23%, respectively.

From a demand perspective, the downstream markets for TiB₂ materials are mainly concentrated in wear-resistant ceramics, composite material reinforcement, metal smelting crucibles, electrolytic aluminum cathodes, and high-temperature mechanical components. In recent years, with the rapid development of new energy vehicles, aerospace, and high-end machinery industries, the demand for high-performance wear-resistant and high-temperature corrosion-resistant materials has continued to grow, providing significant growth momentum for the TiB₂ industry. Furthermore, advancements in composite materials and nanopowder technology have driven the expansion of TiB₂ applications in lightweight structures, functional ceramics, and high thermal conductivity heat dissipation components, creating new incremental markets.

From the perspective of product and technology roadmap evolution, TiB₂ materials are developing from traditional micron-sized powders towards nanoscale, composite, and multifunctional directions, with high purity, uniform particle size, and surface modification capabilities becoming core competitive advantages. Some manufacturers are improving thermal conductivity, hardness, and oxidation resistance by doping with nitrides or metal elements, achieving customized solutions for specific applications. From a policy environment and industry dynamics perspective, China and some European countries provide policy support and research investment for the development of high-end ceramic materials, while promoting the localization of the industrial chain and the implementation of high-end applications, providing opportunities for regional enterprises to expand production and upgrade technology. The global competitive landscape is expected to maintain a steady development driven by the coexistence of international giants and local SMEs, driven by technological iteration. Based on overall trend analysis, the TiB₂ industry is expected to maintain steady growth in the short term, primarily driven by demand from downstream wear-resistant ceramics and composite materials. Simultaneously, the commercialization of nano- and functionalized powders will gradually increase product added value. While alternative materials such as boron nitride and silicon carbide are competitive in some applications, TiB₂'s advantages in thermal conductivity, wear resistance, and chemical stability remain significantly differentiating it. The industry's medium- to long-term prospects are robust, and technological barriers are substantial.
