The report requires updating with new data and is sent in 48 hours after order is placed.

A titanium dioxide-based photocatalyst utilizes titanium dioxide (TiO<sub>2</sub>) as a material that can accelerate photoreactions upon exposure to light, typically ultraviolet (UV) light. When illuminated, TiO<sub>2</sub> generates electron-hole pairs that can initiate redox reactions, leading to the degradation of organic pollutants, the splitting of water molecules, and the killing of bacteria and viruses. Its strong oxidative power, chemical stability, non-toxicity, and cost-effectiveness make it a widely used material in environmental purification applications, such as air and water treatment, self-cleaning surfaces, and antimicrobial coatings. Advances in nanotechnology have further enhanced the efficiency of TiO<sub>2</sub> photocatalysts by increasing their surface area and modifying their electronic properties, allowing for better utilization of visible light and improved photocatalytic activity.

The global Titanium Dioxide-based Photocatalyst market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
