The global Titanium Getter Pump market size is predicted to grow from US\$ 29.18 million in 2025 to US\$ 43.36 million in 2032; it is expected to grow at a CAGR of 6.0% from 2026 to 2032.

In 2025, global Titanium Getter Pump production reached approximately 4,811 Units. The average price is approximately \$6,200. Titanium Getter Pump is an evaporative getter pump used in ultra-high vacuum and extreme-high vacuum systems. It typically uses titanium or titanium-molybdenum filaments, titanium balls, or other titanium source assemblies as the active pumping material.

Titanium Getter Pump market should be treated as a specialized UHV/XHV vacuum sub-segment rather than a broad industrial pump market. A TSP creates a fresh reactive titanium film by sublimating titanium under vacuum and uses that film to pump getterable gases such as hydrogen, oxygen, nitrogen, water vapor, carbon monoxide, and carbon dioxide. Its value lies less in high-volume standardized equipment sales and more in its function as a critical vacuum-performance module within accelerator beamlines, surface science instruments, molecular beam epitaxy systems, semiconductor process and metrology tools, electron microscopy, and customized scientific vacuum platforms. This distinction is important for market sizing: broad ion pumps, NEG pumps, cryopumps, turbomolecular pumps, vacuum chambers, and complete UHV instruments should not be counted as TSP revenue unless the TSP-specific portion can be reasonably attributed. Official product pages from leading suppliers show that commercial offerings are typically sold as cartridges, filaments, titanium source assemblies, cryoshrouds, controllers, power supplies, or TSP-integrated ion pump packages rather than as mass-market standalone pumps.

The global supply structure is concentrated but not monopolistic. North America and Europe have the densest supplier base, combining large vacuum brands, specialized UHV manufacturers, aftermarket suppliers, and controller companies. Agilent and Gamma Vacuum represent important branded supply lines, while Thermionics, Atlas Technologies, Duniway, VACGEN, PREVAC, Hositrad, Scienta Omicron, and Arun Microelectronics cover a mix of pump heads, TSP assemblies, controllers, replacement filaments, and UHV system-specific components. Japan is represented mainly by Canon ANELVA and ULVAC, both of which have strong relevance in vacuum equipment and UHV applications. China currently shows stronger evidence in TSP controllers and local sales/service channels than in independently verified pump-body OEM production; ACME's official titanium sublimation pump controller page is the strongest confirmed local evidence, while additional Chinese vacuum equipment companies remain watchlist candidates pending official product confirmation.

Demand growth is expected to remain steady rather than explosive. The most resilient demand comes from scientific research facilities, accelerator and beamline maintenance, surface science laboratories, semiconductor tool development, analytical instruments, and replacement of consumable titanium filaments or legacy controllers. Semiconductor capital expenditure cycles can influence short-term demand, but TSP is rarely a headline procurement category; it is normally embedded within broader vacuum subsystems. Future competition will therefore depend on system integration capability, compatibility with ion pumps and UHV chambers, automation of sublimation cycles, controller reliability, filament life, clean operation, and the ability to support long-lived installed bases. Replacement risk from NEG pumps, advanced ion pumps, and cryogenic pumping packages is real in some applications, but TSP retains practical advantages where high active-gas pumping speed, low cost per pumping capacity, and simple UHV compatibility are valued. The market outlook is best described as mature, technically resilient, and moderately growing, with a narrow but stable global revenue base.
