The global Titanium Phosphate market size is predicted to grow from US\$ 398 million in 2025 to US\$ 718 million in 2032; it is expected to grow at a CAGR of 8.8% from 2026 to 2032.

Titanium phosphate refers to a class of inorganic compounds (commonly TiP_2O_7 , $Ti(HPO_3)_2 \cdot xH_2O$, and related frameworks) characterized by strong ion-exchange capacity, chemical stability, and thermal resistance, making them widely used in catalysis, proton conductors, ion-exchange materials, battery components, and advanced ceramics. The supply chain begins upstream with raw materials such as titanium sources (typically titanium dioxide derived from ilmenite or rutile ores) and phosphoric acid (produced from phosphate rock). In the midstream, chemical manufacturers synthesize titanium phosphate through precipitation, hydrothermal, or solid-state reactions, followed by purification, drying, and particle engineering depending on application requirements. Downstream, the material is integrated into end-use sectors including energy storage (solid-state batteries and proton exchange membranes), chemical catalysis, environmental treatment (heavy metal adsorption and ion exchange), and specialty ceramics, with demand driven by growth in clean energy, advanced materials, and environmental technologies. In 2025, global Titanium Phosphate output was about 250,000 tons with 320,000 tons of capacity, average prices of USD 1,500-3,000 per ton, and gross margins around 31%.

United States market for Titanium Phosphate is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
