A toggle type injection molding machine is a plastic molding device that uses a mechanical linkage system to open and close the mold and provide clamping force. Its core structure typically consists of upper and lower platens connected by multiple linkages and sliders. When a hydraulic cylinder or servo motor drives the slider, the multi-point linkages leverage a lever mechanism to close the platens rapidly and generate very high clamping force; during ejection, the linkages reverse to open the platens quickly for product removal. Compared with a conventional hydraulic direct-clamp injection molding machine, the toggle design offers several advantages: First, the clamping mechanism maintains a geometrically locked position throughout the closing stroke, resulting in minimal loss of clamping force and significant energy savings. Second, the multi-point linkages distribute clamping force more evenly, reducing mold deformation or damage caused by uneven platen loading. Third, because the linkage geometry yields a fixed lift height during the open/close cycle, the opening speed can be extremely fast—especially well-suited to short cycle times and high shot rates for small to medium parts. Finally, toggle machines feature a compact mechanical structure and simple maintenance, and can be equipped with servo extrusion or fully electric/hybrid drive systems to achieve even greater precision and energy efficiency.
