Toluidine refers to any of the three isomeric compounds derived from toluene, each containing an amino group (-NH<sub>2</sub>) attached to the benzene ring. The three isomers of toluidine are ortho-toluidine (o-toluidine), meta-toluidine (m-toluidine), and para-toluidine (p-toluidine). They differ in the relative positions of the amino group and the methyl group on the benzene ring. Ortho-toluidine has the amino group adjacent to the methyl group (positions 1 and 2), meta-toluidine has the groups separated by one carbon (positions 1 and 3), and para-toluidine has the groups directly opposite each other on the benzene ring (positions 1 and 4). These structural variations affect their physical properties, reactivities, and uses in the chemical industry, where they serve as intermediates in the synthesis of dyes, drugs, and other chemical compounds.

The global Toluidine Isomers market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
