Top-loading laboratory autoclave is a device used for autoclaving in a laboratory environment. Unlike front-loading autoclaves, top-loading autoclaves have a loading area at the top of the unit where the user places the items to be sterilized. Top-loading autoclaves usually use the principle of pressure vessels, using high-temperature and high-pressure steam to kill or remove microorganisms, bacteria, viruses and other

potential sources of contamination in the laboratory. It can thoroughly sterilize experimental instruments, culture media, cultures, media and waste to ensure the aseptic conditions of laboratory operations and the reliability of experimental results. Top-loading autoclaves typically have an openable top cover that allows the user to place items to be sterilized in the top-loading area and then close the cover to ensure an airtight seal. During the sterilization process, the equipment heats water or generates steam to form a high-pressure environment to sterilize the items in the loading area.
