The global Top Pressure Recovery Turbine Generating System market size is predicted to grow from US\$ 187 million in 2025 to US\$ 226 million in 2032; it is expected to grow at a CAGR of 2.8% from 2026 to 2032.

Top Pressure Recovery Turbine Generating System is a device that recovers the residual pressure energy of the gas in the blast furnace, and is usually installed in the exhaust system of the blast furnace. During the production process, the blast furnace will produce a large amount of high-temperature and high-pressure exhaust gas. If these exhaust gases are discharged directly, it will not only waste energy but also cause environmental pollution. The residual pressure energy recovery turbine unit uses the residual pressure in these exhaust gases to drive the turbine unit for mechanical energy conversion, and then drives the generator or other equipment to generate electricity or provide power. The working principle of the unit is to convert the residual pressure energy in the exhaust gas into mechanical energy through the turbine expansion process, and then convert the mechanical energy into electrical energy through the generator, or provide power for other production equipment. In this way, not only can the residual pressure energy discharged by the blast furnace be effectively utilized to improve energy utilization efficiency, but also the production cost can be reduced and the dependence on external energy can be reduced. At the same time, it helps to save energy and reduce emissions, and improve the economy and environmental protection of blast furnace production.
