TOPCon silver powder refers to high-purity Ag powder used as the main conductive functional phase in Ag-based metallization pastes for TOPCon (Tunnel Oxide Passivated Contact) crystalline-silicon solar cells. In industrial TOPCon, metallization is commonly done by screen printing silver-containing pastes followed by contact firing, and the Ag powder's particle size distribution, morphology, and surface condition strongly influence printability, sintering densification, and contact resistivity.

Upstream, PV-grade Ag powder is typically produced from silver salts (commonly silver nitrate solutions) via liquid-phase/wet-chemical reduction, using reducing agents and surfactants/dispersants to control particle size/morphology; continuous microreactor routes are also studied for tighter control. Downstream, the powder is formulated with glass frit + organic vehicle/additives into TOPCon silver pastes for front/rear printing.

In 2025, global sales of TOPCon silver powder reached approximately 4,867 tons, with an average global market price of around US\$ 912/kg. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 3% to 15%.
