## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

A pain relief patch is a medicated adhesive patch that is placed on the skin to deliver a specific dose of medication through the skin and into the bloodstream. Often, this promotes healing to an injured area of the body. An advantage of a transdermal drug delivery route over other types of medication delivery such as oral, topical, intravenous, intramuscular, etc. is that the patch provides a controlled release of the medication into the patient, usually through either a porous membrane covering a reservoir of medication or through body heat melting thin layers of medication embedded in the adhesive.

The global Topical Pain Relief Patch market size is projected to grow from US\$ 6360 million in 2024 to US\$ 8768 million in 2030; it is expected to grow at a CAGR of 5.5% from 2024 to 2030.
