Topical wound agents are preparations such as creams, emulsions, oils and sprays, formulated for wounds and dermatologic conditions. Topical agents indicated for wounds generally provide moisture to the wound bed and may also support autolytic debridement or reduce odor. These agents are essentially used to control pain, inflammation, and infection. Topical wound agents include antiseptics, antibiotics, and non-steroidal anti-inflammatory agents. Antibiotics are agents, which help to kill or inhibit the growth of microorganisms. Antiseptics and disinfectants are primarily used to control infection and NSAIDs used for pain management.
