Toroidal lenses are optical elements formed by rotating an arc around an axis with another arc, which have two curvatures in the x direction and the y direction, and the two directions are shaped separately. After reflection, there is no image deformation problem of ordinary plane reflectors and single spherical reflectors, which reduces the volume of the optical system and makes the optical system more compact. Debugging is more convenient and simple, improves the performance of optical systems, and is widely used in optical instruments, imaging systems, scanners, bioanalytical instruments, medical equipment, etc.

The global Toroidal Lenses market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
