The global Torque Flow Pump market size is predicted to grow from US$ 32780 million in 2025 to US$ 42850 million in 2031; it is expected to grow at a CAGR of 4.6% from 2025 to 2031.

A torque flow pump, also known as a helical rotor pump or a progressive cavity pump, is a type of positive displacement pump used for pumping viscous, abrasive, or shear-sensitive fluids. This pump operates on the principle of a helical rotor, which rotates eccentrically within a rubber or elastomeric stator, creating a progressive cavity. As the rotor turns, it moves the fluid through the pump in a helical or screw-like motion, generating a consistent and non-pulsating flow.

Manufacturers are exploring the use of advanced materials for rotor and stator components to enhance wear resistance, extend pump life, and improve compatibility with a wider range of fluids, including corrosive and abrasive ones.
