Totally Enclosed Ground Flares (TEGF) are systems for safely handling combustible gases in industrial settings. They mainly include a flare stack, burner, ignition system and more. The principle is to let combustible gases react with air or other oxidants to burn. When industrial gases arrive, they first go through a liquid separation tank. Then the gas enters the flare stack, mixes with air or oxidants at the burner and is ignited. It burns stably in a closed space, turning into harmless substances like carbon dioxide and water. TEGFs are known for high safety, good environmental protection and strong adaptability, playing a crucial role in petrochemical, coal chemical and other industries to dispose of waste gases.
