A touch display is a computer display screen that is an input device. The screens are very sensitive to pressure, basically a user interacts with the system by touch. It is basically coated with the metallic cover that causes a change in the electrical current and get registered as a touch instruction and the information is processed and sent to the controller for further processing.

The adoption rate of touch controller ICs in game consoles is expected to drive the growth prospects for the global touch controller IC market until the end of 2023. The market is witnessing a huge demand for intuitive mobile gaming interface that boosts the adoption rate of touch controller IC in gaming devices. Various gaming devices and components such as consoles – Microsoft Kinect and other handheld devices which include Nintendo 3DS are highly integrated with touch sensitivity components and fuel the demand for touch controller IC technology. Also, a multitude of customers prefer technology with high resistance, low power consumption, multi-touch and gesture recognition in gaming devices, which encourages manufacturers to come up with better touch sensitive functionality on these gaming devices, in turn, driving the adoption of touch controller ICs.
