The infrared sensor faucet is based on the principle of infrared reflection. When the human hand is placed in the infrared region of the faucet, the infrared light emitted by the infrared transmitting tube is reflected to the infrared receiving tube due to the blocking of the human hand, and the signal is sent through the microcomputer processing in the integrated circuit. For the pulse solenoid valve, the solenoid valve opens the valve core according to the specified command after receiving the signal to control the water from the faucet; when the human hand leaves the infrared sensing range, the solenoid valve does not receive the signal, and the solenoid valve core is reset by the internal spring to control Turn off the water from the faucet.
